

ETD

Vertical Pipeline
Circulation Pump

ETD Vertical Pipeline Circulation Pump

Model Definition

Product Overview

ETD type single stage pipeline circulation pump, equipped with standard motor and mechanical seal, has a structure that is less susceptible to impurities in the pumped liquid compared to similar types of products.

The product is designed in a detachable form that can be pulled out from the top, allowing for pump maintenance without affecting the piping system.

The ETD32-ETD150 caliber products have an extended shaft structure, while the ETD200-ETD300 caliber products have a detachable structure.

The detachable structure adopts a containerized mechanical seal, and there is no need to disassemble the motor when replacing the mechanical seal.

Operating Condition

The product is suitable for conveying thin, clean, non corrosive, non flammable and explosive liquids that do not contain solid particles, fibers, or liquids with physical and chemical properties similar to water. When used in situations where the liquid is viscous or dense, it can cause a decrease in the pump characteristic curve and an increase in energy consumption.

Maximum working pressure:

12 bar for conventional models; Special type is 16bar

Liquid temperature: -15°C to 110°C

Environmental temperature: maximum+40°C

Altitude: up to 1000m

Rotation direction: clockwise

(looking down from the motor blade end)

Application

ETD pump is a multi-purpose product that can transport various media from tap water to industrial liquids, mainly used as liquid conveying, pressurization, and circulation equipment.

For example:

Regional heating system (the water quality in the heating system should meet the recognized water quality standards of the system)

HVAC and air conditioning systems

Cooling system

Domestic hot water system

Industrial liquid transportation

Water supply system

Maximum Environmental Temperature, Altitude

When the pump operates at an ambient temperature greater than 40°C or an altitude greater than 1000m, due to low air density, the cooling effect is poor, and the output power P₂ of the motor will be reduced to a certain extent.

The motor power needs to be increased when the pump operates under the above conditions.

Motor

The motor is a fully enclosed, air-cooled standard motor with two or four poles.

Protection level: IP55

Insulation class: F

Standard voltage: 50Hz: 1x220-230/240V

3x200-220/346-380V

3x220-240/380-415V

Product Mix

The product adopts a detachable structure between the motor and pump, and the pump part is designed to be pullout.

All such products are equipped with standard motors and mechanical seals. The motor is a fully enclosed, aircooled standard motor.

The product pump body is equivalent to a section of pipeline. When repairing the pump, blind flanges can be used to seal the pump body, so as not to affect the normal operation of the system.

The connecting flange size of the product complies with the GB/T17241.6 (ISO7005-2) standard, and the pressure rating is PN16.

The import and export diameters of the product comply with relevant standard dimensions.

The pump head of the product is a device that connects the motor and pump body. The sealing element between it and the pump body adopts an O-ring.

Minimum Inlet Pressure - NPSH

If the pressure in the pump is lower than the vaporization pressure of the conveyed liquid, cavitation may occur. To avoid cavitation, ensure that there is a minimum pressure on the inlet side of the pump, and the maximum suction head H (meters) can be measured using the following formula:

$$H = p_b \times 10.2 - NPSH - H_f - H_v - H_s$$

H - Maximum suction head (meters)

p_b - atmospheric pressure (bar)

In a closed pipeline, it can be considered as the system pressure (bar) of a closed system.

NPSH net positive suction head (meters)

It can be read at the maximum flow rate corresponding to the NPSH curve in the performance curve.

H_f - Pipeline loss at the inlet (meters)

It is the value corresponding to the maximum flow rate that the pipeline may generate.

H_v - Vaporization pressure of liquid (meters)

The magnitude of its value depends on the vaporization pressure value of the liquid's temperature.

H_s - Safety margin (meters)

The minimum pressure head is 0.5 meters.

By calculation, if "H" is a positive value, it indicates that the pump can operate at the maximum suction head "H"; If "H" is negative, it means that the pump must have a minimum pressure of the corresponding "H" meter at the inlet in order to operate normally.

Note: In general, the above calculations are not performed. Calculate "H" only when using the pump in the following situations:

1. High liquid temperature
2. The liquid flow rate exceeds the rated value
3. Large suction head or long inlet pipeline
4. System pressure too low
5. Poor import conditions

Installation Condition

The product has different installation requirements, and the specific installation requirements are as follows:

1. The system pipeline has the ability to support the pump, and pumps equipped with $\leq 2.2\text{kW}$ motors can be directly suspended in the pipeline;
2. For pumps equipped with motors $\leq 2.2\text{kW}$, they can be installed horizontally or vertically on the working pipeline; For pumps equipped with motors greater than 2.2kW , they must be installed vertically in the horizontal direction in the working pipeline. (Figure 2-A)
3. The installation of the pump should ensure that the tension of the system pipeline should not be transmitted to the pump body during use.
4. To ensure the normal operation of the motor, the pump should be installed in an environment with sufficient cooling, and the temperature of the cooling air should not exceed 40°C .
5. If the pump is installed outdoors, a suitable cover must be provided to prevent water ingress or condensation of electrical components.
6. In order to facilitate inspection and maintenance of the pump, sufficient space must be left above and below the pump. When the matching motor of the pump is less than 5.5kW , a minimum of 300mm should be left; When the matching motor of the pump is $\geq 5.5\text{kW}$, a minimum of 1000mm should be left. (Figure 2-B)
7. To prevent noise and vibration and ensure optimal operation, the pump should be installed with a vibration reducing base. Generally, a cement base is used, and the weight of the base should be ≥ 1.5 times the weight of the pump. (Figure 2-C)
8. To meet the different needs of customers, ETD32-ETD150 products are divided into two types: with a base plate and without a base plate. (See Attachment 1 for the size of the base plate)
